VITAL STATISTICS - ILLINOIS - 1991

INTRODUCTION

This report is in four parts: a summary, generally limited to statewide and large-scale regional tabulations, and a narrative; tabulations for each county and health service area; tabulations for cities of 25,000 population or more; and technical appendices.

Downstate, as used in this report, refers to all areas of Illinois outside the corporate limits of the city of Chicago, unless otherwise stated.

Data in this report are based on birth, death, fetal death, marriage, and divorce certificates, which by law must be filed with the Illinois Department of Public Health. The birth, death, and fetal death tables include data received from other states and Canada on Illinois residents who were born or died in their jurisdictions, and exclude data on nonresidents of Illinois who were born or died in this state. The marriage and divorce tables include all and only those events that occurred in Illinois. Appendix 1 includes samples of the certificates and a description of the vital statistics system.

Vital rates cited in this report for years prior to 1990 are based on revised intercensal population estimates obtained from the U.S. Bureau of the Census and may differ from those published in previous editions of "Vital Statistics, Illinois."

Starting with 1989 data, the tabulation of births and fetal deaths by race has changed. In prior years, birth and fetal death tabulations were by race of child, based on information reported for the mother and father. In cases where only one parent was white, the child was assigned to the other parent's race. When neither parent was white, the child was assigned the race of the father. Beginning with the 1989 data year, births and fetal deaths were tabulated by race of mother, as reported on the certificate. Changing the basis for tabulation to race of mother results in more births and fetal deaths classified as white and fewer classified as black or of other races.

In Part II, there are two pages for each county, health service area (HSA), and the state. The numbers of events are provided for white and black race groups as well as for persons of Hispanic origin (persons of Hispanic origin may be of any race). On the first page, detailed natality information is presented along with infant mortality data. On the second page, detailed mortality data are given by age at death and by cause. Rates are calculated for the total population as well as for the population ages 0 to 64 years and 65 years and older. In addition, the years of potential life lost (YPLL) is presented as an indicator of premature death.

NUPTIALITY

MARRIAGE

The total number of marriages registered in Illinois was 94,771 in 1991. This number represents a 5.8 percent decrease from the number of marriages registered in 1990 (100,632). While the number of marriages in 1991 decreased from the previous year, the 1991 total was still well above the number in 1988 (78,302).

The historical fluctuations in the number of marriages reflect primarily the changes in the marriage rate (the number of marriages per 1,000 population) rather than changes in the population size. The marriage rate declined from 8.8 in 1990 to 8.2 in 1991 (Figure 1). This was the result of nearly 6,000 fewer marriages in 1991. Similarly, the lower marriage rate in 1991, compared with 1980 (9.6), is primarily the result of fewer marriages in 1991 rather than differences between the sizes of 1980 and 1991 populations.

Recent rather sharp fluctuations in the marriage rate appear to be largely the result of the human immunodeficiency virus (HIV) testing requirement for obtaining a marriage license initiated in Illinois in 1988. The marriage rate in 1988 dropped sharply, coinciding with the HIV testing requirement, and rebounded in 1989 and 1990 following the repeal of the testing requirement (Table R). The 1991 marriage rate, while lower than that in 1990, appears to be more in line with the longer-term trend established prior to 1988.

To a large extent, the smaller number of marriages in 1991 than in 1980 can be attributed to the fact that the proportion of the population 20 to 29 years of age, who have the highest marriage rate, shrank from 1980 to 1991 as the baby boom generation aged. Such a demographic change not only lowered the marriage rate, it also raised the median age of marriage from 25 years in 1980 to 28 years in 1991 for grooms, and from 23 to 26 years for brides.

As in previous years, young adults 20 to 29 years of age accounted for a majority of the number and percentage of marriages in 1991. More than 53 percent of the grooms and 56 percent of the brides were in this age group (Table S), while the male (or female) population 20 to 29 years of age accounted for a much smaller proportion of the total male (or female) population. The population 30 years of age and over accounted for an increasingly larger proportion of the marriages. In 1991, almost 43 percent of the grooms were in this age group, compared to 31 percent in 1980. Similarly, the proportion of the brides 30 years of age and over increased from 23 percent in 1980 to nearly 35 percent in 1991.

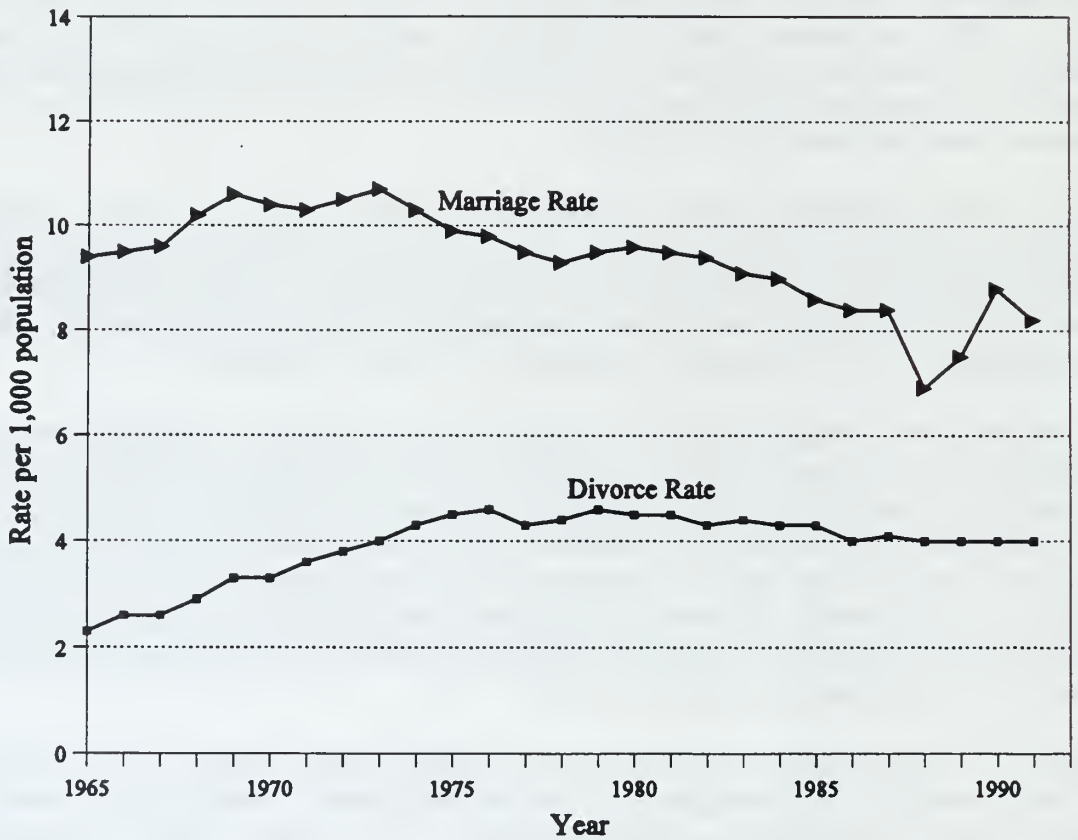
In addition to varying by age, marriage rates also varied by race. Whites were more likely to marry than nonwhites. The marriage rate for whites (the number of marriages with white bride and white groom per 1,000 white population) was 8.3 in 1991, compared with 6.2 for nonwhites.

Marriage also varied by location of occurrence. Among the counties within the Chicago metropolitan area, Will had the lowest marriage rate (6.6) while Kane and Lake had the highest (both 9.3). The marriage rate for Cook County was 7.7 in 1991, higher than the rate for Du Page (7.1) but lower than that for McHenry (8.0). Downstate Illinois had a higher marriage rate (9.1) than the Chicago metropolitan area counties, except Lake and Kane.

More than 32 percent of the brides and grooms in 1991 had been married before (Table T). Both grooms and brides who had been married more than once before accounted for approximately 7 percent of the total marriages. Only 1.4 percent of the grooms and 1.6 percent of brides had been married more than twice.

In 1991, among both grooms (30,004) and brides (30,171) who had been married before, more than 91 percent of them had been divorced (Table U). The widowed, those whose previous marriages had been annulled, and those whose previous marriage status was unknown accounted for the remaining 9 percent of the marriages.

FIGURE 1. -- MARRIAGE AND DIVORCE RATES: ILLINOIS, 1965-1991



DIVORCE AND ANNULMENT

The number of divorces and annulments in 1991 totaled 45,813 (45,659 divorces and 154 annulments), essentially the same number as in the years from 1986 (45,852) to 1990 (45,977). It represents, however, a substantially smaller number of divorces and annulments (hereafter collectively referred to as "divorces") than were recorded each year between 1973 and 1986. On average, for example, the number of divorces in the early 1980s was 5,000 more than the number in 1991.

An explanation for the smaller number of divorces in 1991, as well as in the immediately preceding years, lies in the lower divorce rate rather than the smaller size of the adult population. The divorce rate per 1,000 population reached a peak of 4.6 in 1976 and 1979. The rate has since gradually declined to the current rate of 4.0, stable since 1988 (Figure 1).

Census and divorce data suggest that a portion of the decline in the divorce rate from 1980 to 1991 may be attributed to the change in age composition of the state population. That is, decline in the divorce rate during the 1980s was at least partially due to a decreasing proportion of young adults (who had the highest divorce rate) and an increasing proportion of older adults (who had a lower rate).

While the male population 20 to 34 years of age accounted for about one-third of the male population 15 years of age and over, almost one-half (47.8%) of the divorced husbands were in this age group (Table V). This proportionate imbalance, indicating a higher divorce rate among young adult males, was even more pronounced for females. While 30 percent of the female population 15 years of age and over were in the age group 20 to 34 years, almost 56 percent of the divorced wives were in this same age group.

The divorce rate for whites (the number of divorced white husband-white wife couples per 1,000 white population) was somewhat higher than the rate for nonwhites (the number of divorced nonwhite husband-nonwhite wife couples per 1,000 nonwhite population). The divorce rate for whites was 3.2 in 1991, compared to 2.8 for nonwhites. More than 10 percent (4,612) of the total number of divorces involved couples where one or both persons' racial backgrounds were unreported.

Most divorces occur relatively early in marriage. (For just annulments, in 1991, almost one-half occurred before the end of the first year of marriage.) As in 1990, the number of divorces in 1991 was highest for couples who had been married three years and generally declined with increasing duration of marriage. More than 35 percent of divorcing couples had been married less than five years and almost 63 percent had been married less than 10 years (Table W).

In 1991, the number of children younger than 18 years of age involved in divorce was 42,712 . Not only was this number lower than the 43,151 children involved in divorce in 1990, but the proportion of children affected by a divorce decreased also. The rate of children involved in divorce per 1,000 children under 18 years of age was 14.3 in 1991 compared to 14.5 in 1990, 14.2 in 1989 and 14.0

in 1988. Among the 44,343 divorces where the presence of children was stated, approximately 55 percent of divorcing couples in 1991 had children under age 18 years: 25 percent had one child, while 20 percent had two children, and 9 percent had three or more children. For 3 percent of divorcing couples, the number of children involved was unstated.

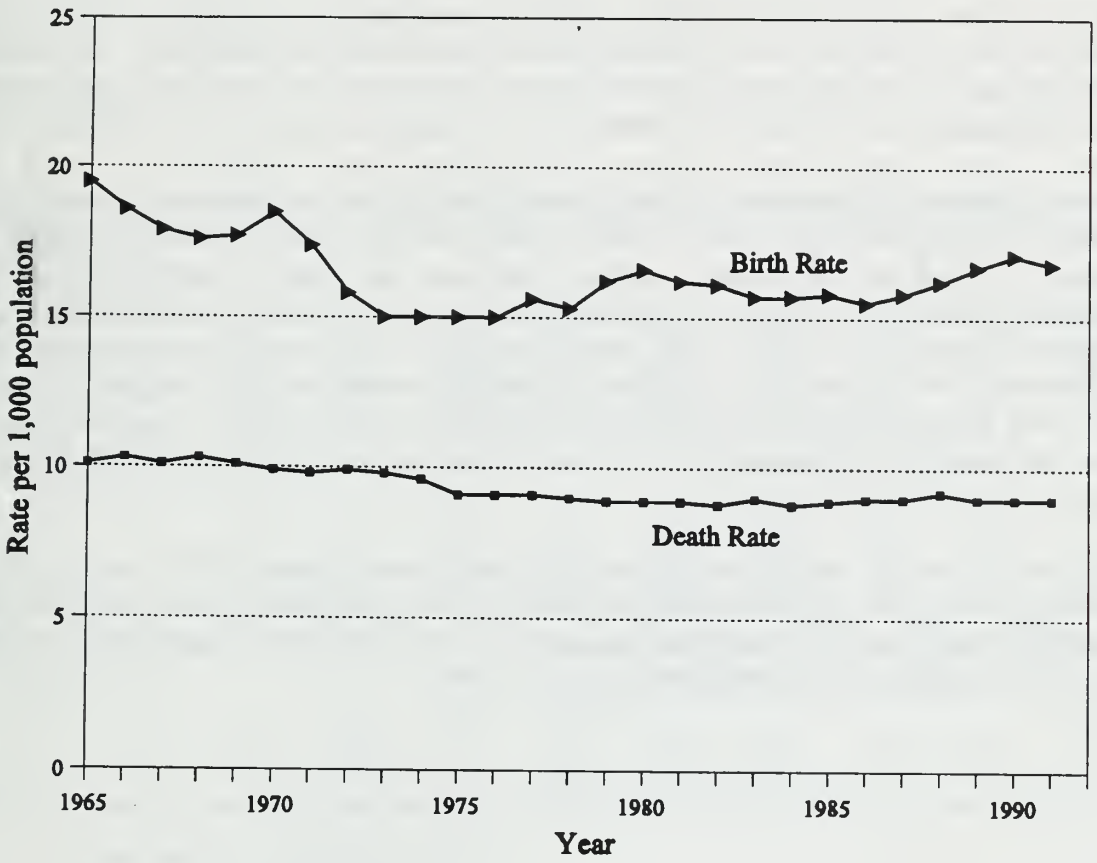
Tables R through W present data on marriage and divorce.

NATALITY

LIVE BIRTHS

There were 194,066 registered live births to Illinois residents in 1991. That number was lower than the number of registered live births to Illinois residents in 1990 (195,499), but still was the second highest total since 1971. The number of live births registered in 1991 represented the first decline in such numbers since 1986. Likewise, the crude birth rate (number of live births per 1,000 population) of 16.8 declined by 1.8 percent and was the first decline in the crude birth rate since 1986 (Figure 2).

FIGURE 2. -- BIRTH AND DEATH RATES: ILLINOIS, 1965-1991



The general fertility rate (number of live births per 1,000 women 15-44 years of age) also declined from 1990 to 1991. The 1991 rate of 71.9 per 1,000 women of childbearing age was 1.4 percent below the 1990 rate of 72.9 and, as with other birth indicators, was the first such decline since 1986.

Rates for both the white population (67.2) and nonwhite population (91.2) were below their 1990 values (68.3 and 91.3, respectively).

The decrease in the overall general fertility rate is reflected in corresponding decreases in several age-specific birth rates, especially within the major childbearing period of 20 to 34 years of age. Birth rates for women 15 to 19 years of age and women 35 to 39 years of age were the only two age-specific birth rates to have increased from 1990 to 1991 (Text Table 1).

For women 35 to 39 years of age, the proportion of births that are first children was higher than in 1980. In 1980, 9.3 percent of all births to women in the age group 35 to 39 year were first children. By 1990, that percentage had increased to 13.6. In 1991, 13.5 percent of all births to women 35 to 39 years of age were first children. For mothers under 25 years of age, the percentage of all births that were first children decreased over the same period, indicating that for those mothers giving birth at younger ages, more births are of higher order.

Text Table 1 also shows that the fertility rates varied considerably by age group. The fertility rate peaked with the age group 25 to 29 years and then dropped with increasing age. The variability in the fertility rates by age, coupled with the differences in the numbers of women in childbearing age groups, determined the distribution of births by age of mother as shown in Text Table 1.

The level of educational attainment, an item tabulated directly from the birth certificates, is generally inversely related to the fertility rate. However, more than 41 percent of the live births in Illinois occurred to women with at least some college education (Text Table 2), virtually the same as the comparable proportion for 1990. As in the previous three years, about 78 percent of the live births occurred to women with at least a high school education. The educational attainment of mothers varies with race. For example, the proportion of white mothers with at least a high school education in 1991 was about 81 percent, compared to 67 percent for black mothers. This difference mainly reflects the proportion of mothers with at least a four-year college education (23.4% for white mothers and 6.1% for black mothers).

The number of infants born in multiple deliveries (e.g., twins, triplets) in 1991 was 5,056, nearly 100 more than in 1990. Multiple deliveries accounted for more than 2.6 percent of the total live births, slightly higher than the comparable proportion in 1990. The proportion of multiple births has grown fairly steadily, having risen from 2 percent in 1980.

TEXT TABLE 1. -- RESIDENT LIVE BIRTHS AND BIRTH RATES BY AGE OF MOTHER FOR TOTAL AND FOR FIRST BIRTHS: ILLINOIS, 1980, 1990, 1991
(Rates per 1,000 women in specified age group)

Year and birth order	Total	10-14 years	15-19 years	20-24 years	25-29 years	30-34 years	35-39 years	40-44 years	45-49 years

[1]Included in "nonwhite"
[2]Excludes births with unknown educational attainment of mother

BIRTHS TO UNMARRIED WOMEN

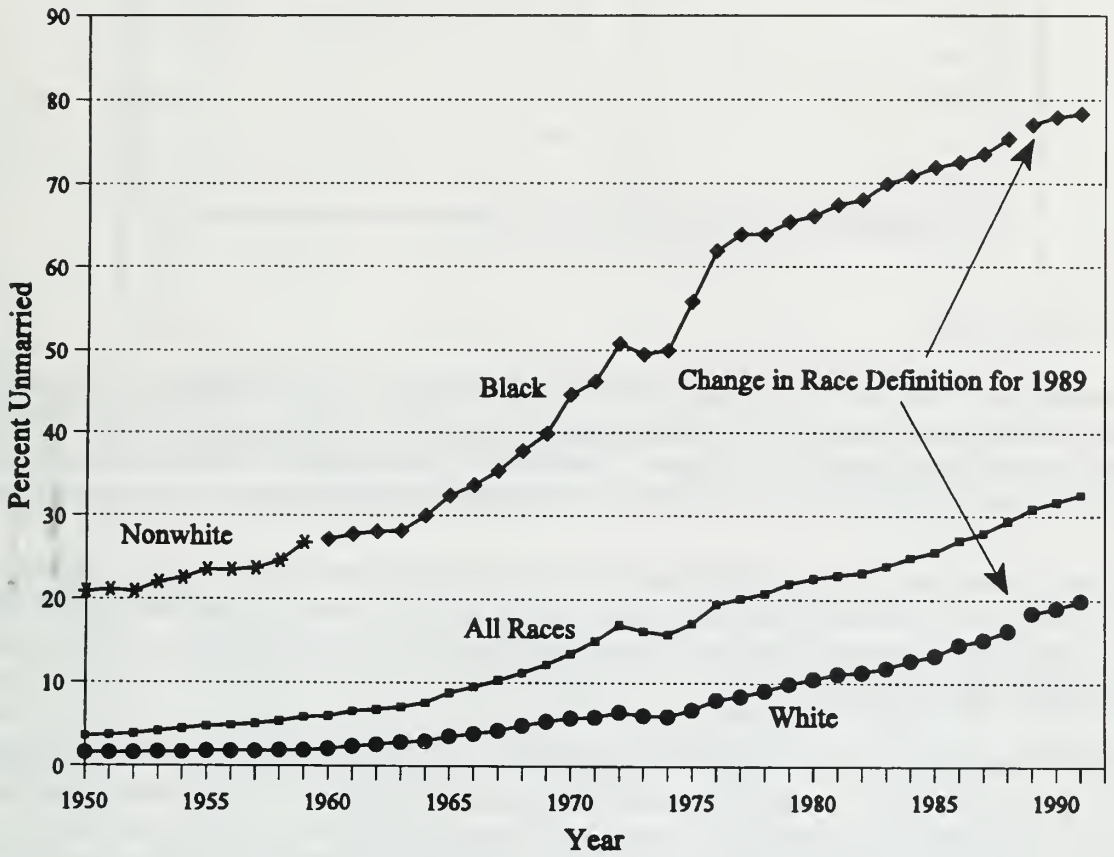
The number of births to unmarried women in Illinois continued to rise, but more slowly than in past years. Births to unmarried women totaled 63,172 in 1991, an increase of less than 2 percent over the number in 1990 (62,052), but an increase of nearly 48 percent over the corresponding number in 1980 (42,749). Births to unmarried women in 1991 accounted for about 33 percent of all births, nearly the same proportion as that recorded in 1990 (32%).

For each age group, the proportion of all births that are to unmarried women changed little from 1990. In 1991, 80 percent of all mothers over 15 to 19 years of age were unmarried, a figure unchanged from 1990, and still higher than the 57 percent in 1980 (Text Table 3). The proportion of nonmarital births increased among women 20 to 24 and 25 to 29 years of age. The proportion of nonmarital births decreased after 20 to 24 years of age. The proportions were the smallest for mothers 30 to 34 and 35 to 39 years of age (both 13%).

The number of births to unmarried women was disproportionately larger among blacks compared to whites. The number of births to unmarried black women (33,724) accounted for more than 53 percent of the total nonmarital births in 1991, while black births comprised only 22 percent of all Illinois births (Table C). Approximately 78 percent of the births to black women were nonmarital births, compared to 20 percent among white women (Figure 3). The difference in the proportion of

nonmarital births between these two races varied with age of mother, but remained substantial across all age groups.

FIGURE 3: -- ILLINOIS RESIDENT BIRTHS TO UNMARRIED WOMEN BY RACE: 1950-1991



Nonmarital births also varied with residence. The number of nonmarital births in the city of Chicago (33,076), for example, accounted for more than 52 percent of the total nonmarital births in 1991, despite the fact that only 24 percent of the state's population resided in Chicago. More than half (55%) of the total births in Chicago were nonmarital births compared to 23 percent Downstate.

TEXT TABLE 3. -- PROPORTION OF NONMARITAL BIRTHS BY AGE OF MOTHER: ILLINOIS, 1980, 1990 AND 1991

Age of mother (years)	Proportion of nonmarital births		
	1980	1990	1991
15-19	.57	.80	.80
20-24	.25	.45	.47
25-29	.11	.19	.21
30-34	.08	.13	.13
35-39	.09	.13	.13
40 and over	.15	.16	.15

PRENATAL CARE

The proportion of mothers who began prenatal care during the first trimester of pregnancy has remained rather steady since 1983 at approximately 78 percent. This proportion was 77.5 percent in 1991, slightly lower than the 1990 value. Similarly, the proportion of mothers initiating care in the third trimester or receiving no care at all has remained at approximately 5 percent since 1985.

There was a difference by race in the timely receipt of prenatal care. In 1991, the proportions of white mothers and black mothers who began care in the first trimester were 82 percent and 63 percent, respectively. Almost 4 percent of white mothers and 10 percent of black mothers received third trimester care or no care.

Initiation of early prenatal care also varied with age of mother (Text Table 4). In 1991, only 43 percent of mothers under 15 years of age and 56 percent of those 15 to 19 years of age began care in the first trimester compared with 87 percent of those in their 30s. The age disparity in early receipt of prenatal care has widened over the last several years. After dropping during the 1980s, the proportion of mothers 15 to 19 years of age receiving early prenatal care rose slightly between 1990 and 1991 and is now at the 1980 level. The proportion of mothers 20 to 24 years of age receiving early prenatal care has consistently declined since 1980. In contrast, the proportion of mothers 30 years of age and over receiving first trimester care in 1991 was greater than in 1980, although the proportion of mothers 30 to 34 years of age receiving first trimester care declined from 1990 to 1991.

TEXT TABLE 4. -- PRENATAL CARE INITIATED IN THE FIRST TRIMESTER OF PREGNANCY, AS PERCENT OF RESIDENT LIVE BIRTHS BY AGE OF MOTHER: ILLINOIS, 1980, 1985, 1990 AND 1991

Age of mother (years)	Percent initiated in first trimester[1]			
	1991	1990	1985	1980
All ages	77.5	77.8	77.9	75.4
Under 15	42.9	39.8	38.5	36.9
15-19	56.2	55.6	54.6	56.2
20-24	69.4	70.0	72.9	74.0
25-29	83.4	83.8	84.6	83.0
30-34	87.1	87.6	86.9	82.9
35-39	86.5	86.3	84.7	77.2
40 and over	81.5	82.0	75.6	65.3

[1] Excludes births with unknown trimester of pregnancy when prenatal care began

INFANT HEALTH

The proportion of infants who were born in hospitals was about the same in 1991 as in the previous eight years, 99.3 percent. At birth, babies weighing less than 2,500 grams (low birthweight) totaled 15,142 in 1991, or 7.8 percent of all live births. This was an increase from the 7.6 percent in 1990.

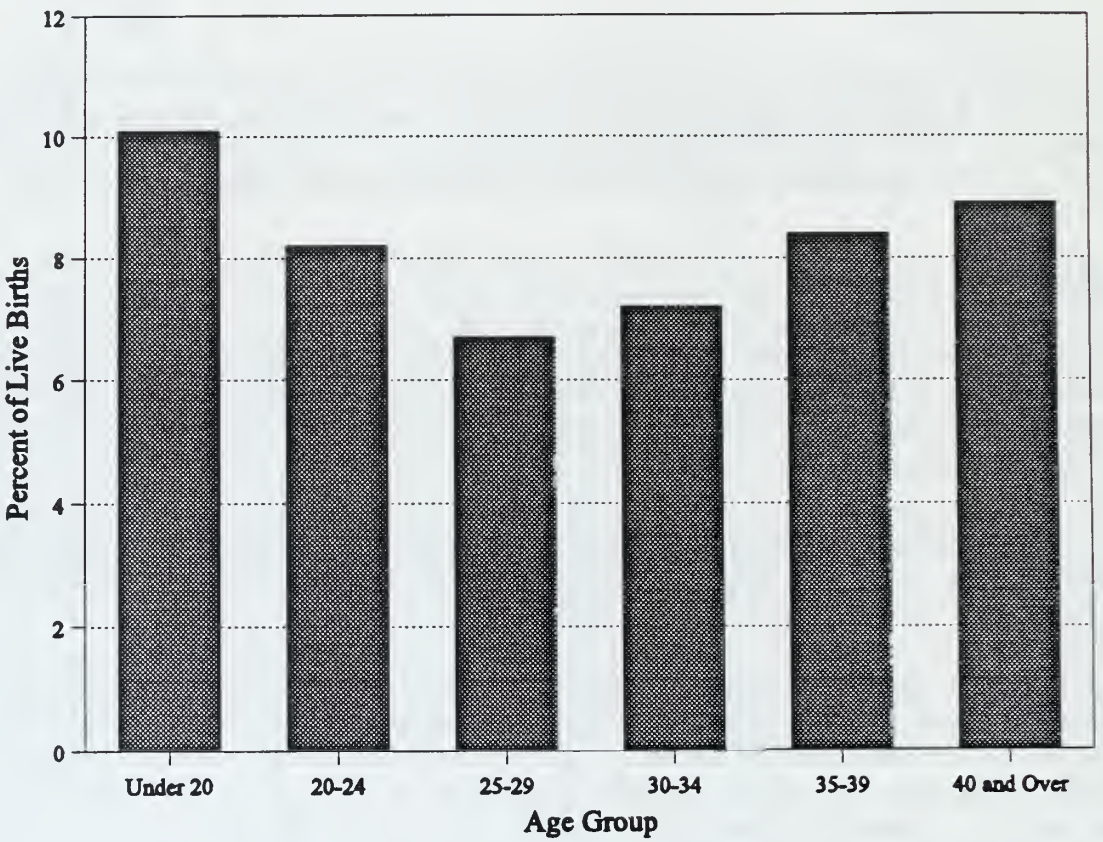
The incidence of low birthweight varied with race. Among black infants, the incidence of low birthweight was 14.9 percent in 1991, up from 14.5 percent in 1990; for white infants, it was 5.7 percent in 1991 compared to 5.6 percent in 1990.

The risk of low birthweight varied with the mother's age (Text Table 5 and Figure 4). The risk was highest (10.8%) for infants born to mothers under 18 years of age, decreasing to the lowest level (6.7%) for infants born to mothers 25 to 29 years of age, and then rising to a higher level (8.9%) for those born to mothers 40 years of age and over. This age-specific U-shaped curve pertaining to the probability of low birthweight was evident among infants born to white women, but less so among infants born to black women where, except for the age groups 18 to 19 and over 40 years, the percentage of low birthweight increased with age of mother.

The risk of low birthweight also varied with marital status (Text Table 5). As in 1990, the 1991 incidence of low birthweight was more than twice as high for infants born to unmarried mothers (12.4 percent) as for infants born to married mothers (5.6 percent). This difference was more than double for mothers 20 years of age and over.

When black mothers and white mothers were examined separately, the differences in the incidence of low birthweight between infants born to unmarried mothers and those born to married mothers were less. Nevertheless, the effect of marital status on the incidence of low birthweight was evident. For both whites and blacks, the difference in the risk of low birthweight was more than 50 percent higher for infants born to unmarried mothers 25 years of age and over than for those born to married mothers.

FIGURE 4. -- PERCENT OF ILLINOIS RESIDENT LIVE BIRTHS WITH LOW BIRTHWEIGHT BY AGE OF MOTHER, ILLINOIS: 1991



Infants born to mothers from Chicago tended to have a higher prevalence of low birthweight than did infants born to Downstate mothers. Nearly 11 percent of all infants born to Chicago

mothers in 1991 experienced low birthweight, compared with 6 percent among Downstate infants (Table B). There were slight differences by race between Chicago and Downstate. Infants born to Chicago black mothers had low birthweights 16 percent of the time versus 13 percent to Downstate black mothers. For whites, it was 6 percent for both Chicago and Downstate.

Another indicator of the health condition of infants is the Apgar score. The Apgar score is a composite evaluation that, on a scale from 0 to 10, measures the newborn's physical condition based on heart rate, respiratory effort, muscle tone, reflex response and color at one minute and five minutes after birth. A score of 10 is optimum. In 1991, high Apgar scores of 9 or 10 were reported for 48 percent of all babies at one minute after birth and 91 percent at five minutes after birth. Low scores of 0 to 6 (indicating severe to moderate asphyxia) were assigned to 7.3 percent of babies at one minute and to 1.4 percent at five minutes in 1991.

TEXT TABLE 5. -- PERCENT OF RESIDENT LIVE BIRTHS OF LOW BIRTHWEIGHT BY MARITAL STATUS, RACE, AND AGE OF MOTHER: ILLINOIS, 1991

	Total			Married			Unmarried		
Age of mother (years)	All races[1]	White	Black	All races[1]	White	Black	All races[1]	White	Black
All ages	7.8	5.7	15.0	5.6	5.1	11.4	12.4	8.4	15.9
Under 20	10.1	7.8	12.7	7.2	6.7	12.9	10.7	8.4	12.7
Under 18 . . .	(10.8)	(8.1)	(13.1)	(7.4)	(7.0)	(*)	(11.2)	(8.4)	(13.1)
18-19	(9.6)	(7.7)	(12.4)	(7.2)	(6.7)	(12.6)	(10.4)	(8.3)	(12.4)
20 - 24	8.2	5.9	13.9	5.5	5.0	10.9	11.2	7.8	14.4
25 - 29	6.7	4.9	15.5	5.0	4.5	10.3	13.3	7.9	18.0

35 and over .	8.5	6.7	19.3	6.9	6.3	13.5	18.6	11.8	24.9
35-39 . . .	(8.4)	(6.7)	(19.3)	(6.9)	(6.3)	(13.6)	(18.6)	(11.4)	(24.8)
40 and over	(8.9)	(6.8)	(19.2)	(8.6)	(6.0)	(12.9)	(19.0)	(14.0)	(26.1)

*Ratio does not meet standards of reliability or precision; numerator less than 10 or denominator less than 100.
[1]Includes races other than white and black

The Apgar score varied with race, mother's age and residence. In 1991, for example, higher proportions of black infants than white infants had low five-minute Apgar scores. About 2.5

percent of black babies had a five-minute Apgar score of less than 7 compared with 1.1 percent of white infants.

BIRTHS TO HISPANIC MOTHERS

The number of births to Hispanic mothers totaled 25,718 in 1991, an increase of more than 6.1 percent over the number in 1990 (24,245). On the other hand, the number of births to non-Hispanic mothers decreased by 1.7 percent, from 171,254 in 1990 to 168,348 in 1991. As a result, the proportion of total live births in Illinois to Hispanic mothers increased from 12.4 percent in 1990 to 13.3 percent in 1991.

Of all Hispanic births in 1991, 74.9 percent were to Mexican mothers and 12.5 percent to Puerto Rican mothers. The percentages for 1990 were 72.8 and 14.1, respectively. In both 1990 and 1991, virtually all Hispanic births, regardless of whether they were to Mexican or Puerto Rican mothers, were reported as white births (Text Table 6).

TEXT TABLE 6. -- NUMBER AND PERCENT DISTRIBUTION OF LIVE BIRTHS BY RACE OF MOTHER, ACCORDING TO HISPANIC ORIGIN OF MOTHER: ILLINOIS, 1991

	All origins	Hispanic				Non-Hispanic
		Total	Mexican	Puerto Rican	Other and unknown	
Number of births						
All races	194,066	25,718	19,260	3,208	3,250	168,348

Black	22.2	1.2	0.7	2.8	2.6	25.4
Other	2.8	0.4	0.1	0.2	2.5	3.2

Hispanic mothers continue to be highly concentrated within a few counties. Almost 90 percent of all Hispanic births in 1991 occurred to residents of three counties (Cook, Kane and Lake). Cook County alone accounted for 79 percent of all Hispanic births in the state, including 90 percent of all Puerto Rican births (Text Table 7).

Hispanic women differed from non-Hispanic women not only in reproductivity, but also in the likelihood of being a teenage mother (Text Table 8). The proportion of teenage mothers among Hispanic mothers was greater (16%) than that among white non-Hispanic mothers (8%), but smaller than that among black non-Hispanic mothers (27%). Although the corresponding

proportion among Puerto Rican mothers (22%) was higher than that among Mexican mothers (16%), it was still lower than that among black non-Hispanic mothers.

Text Table 8 also indicates that Hispanic mothers have a higher proportion of births among the peak childbearing years compared to births among non-Hispanic mothers. Hispanic mothers 20 to 29 years of age accounted for 60 percent of all Hispanic births, while births to non-Hispanic white mothers in this age group accounted for 53 percent and births to non-Hispanic black mothers in the same age group accounted for 54 percent of all births . On the other hand, non-Hispanic white mothers had the largest proportion of births to mothers 30 years of age and over (39%), followed by Hispanic women (24%). The proportion of births to mothers 30 years of age and over was smallest among non-Hispanic black mothers (19%).

Hispanic mothers also differed from non-Hispanic mothers with respect to marital status (Text Table 9). The percentage of childbearing by unmarried mothers increased both among Hispanic and non-Hispanic women between 1990 and 1991. There is a difference, however, between the Hispanic and non-Hispanic populations in the proportions of unmarried mothers. In 1991, 36 percent of Hispanic births (9,228) were to unmarried mothers compared with 32 percent of non-Hispanic births (53,944). However, the proportion of infants born to unmarried women was higher among Hispanic women, especially Puerto Rican women, than that among non-Hispanic white women. The proportion of infants born to unmarried non-Hispanic black women was the highest of any race or ethnicity at more than 78 percent.

In 1991, Hispanic women, both Mexican and Puerto Rican, tended toward a larger number of births than non-Hispanic white women. For example, 22 percent of Hispanic births were to women who already had at least three natural children, compared with 17 percent of non-Hispanic white births (Text Table 9).

As in 1990, Hispanic mothers in 1991 were much less likely than non-Hispanic mothers to have completed high school. In 1991, 42 percent of all Hispanic women giving birth were high school graduates, compared with 89 percent of non-Hispanic white and 66 percent of non-Hispanic black mothers (Text Table 11). Mexican mothers were the least likely to have completed high school. Only 36 percent of Mexican mothers had completed 12 or more years of school and 38 percent had very limited schooling (eight years or less). Hispanic mothers also were less likely to receive prenatal care beginning in the first trimester of pregnancy and more likely to receive delayed care or none at all than non-Hispanic white mothers. In 1991, the proportion of Hispanic mothers who received prenatal care beginning in the first trimester was 63.2 percent, approximately the same as the level for non-Hispanic black mothers (62.8%), but below the level for non-Hispanic white mothers (84.8%). The proportion of Mexican mothers in 1991 who received care beginning in the third trimester or no care at all was 10.0 percent, an increase from 9.8 percent in 1990.

Infants born to Hispanic mothers in 1991 had lower percentages of low birthweight and of one- and five-minute Apgar scores of less than 7 compared to infants born to non-Hispanic mothers. Among babies born to Hispanic mothers, only those born to Puerto Ricans had a higher incidence of low birthweight (8.7%) than those born to non-Hispanic mothers (8.1%). The incidence of low birthweight was highest among infants born to non-Hispanic black mothers (15.0%). Low birthweight incidence among infants born to Mexican and other Hispanic mothers (5.5% and 6.3%, respectively) was similar to that for non-Hispanic white babies (5.7%). The proportions of babies

with five-minute Apgar scores of less than 7 (indicating severe to moderate asphyxia) were virtually the same for those born to mothers among the various Hispanic groups (1.0%) compared to those born to non-Hispanic white mothers (1.1%). One-minute Apgar scores of less than 7 occurred slightly less frequently among infants born to Hispanic mothers (5.8%) than among infants born to non-Hispanic white mothers (6.9%).

TEXT TABLE 9. -- PERCENT OF BIRTHS WITH SELECTED CHARACTERISTICS BY HISPANIC ORIGIN OF MOTHER AND BY RACE OF NON-HISPANIC MOTHERS: ILLINOIS, 1991

Characteristic	All origins	Hispanic				Non-Hispanic			
		Total	Mexican	Puerto Rican	Other and unknown	Total	White	Black	Other

GENERAL MORTALITY

In 1991, there were 103,871 Illinois resident deaths of which 4,436 occurred outside of Illinois. There were 99,435 deaths recorded in Illinois of which 2,029 occurred to persons who were not residents of the state. The total number of resident deaths in 1991 was more than the number in 1990 (102,697) and 1989 (103,027), but less than in 1988 (105,038) (Table A). The crude death rate (number of deaths per 1,000 population) has declined slowly and steadily since 1920. However, since 1975, the crude death rate has fluctuated between 9.2 and 8.8 (Figure 2). The 1991 crude death rate was 9.0, the same as in 1990 and 1989. Nevertheless, one should not conclude that Illinois residents had roughly the same probability of dying in 1991 as, for example, in 1980. Quite to the contrary, the age-specific death rates for each age group were lower in 1991 than the rates in 1980 (except for persons 25 to 44 years of age; Text Table 10).

TEXT TABLE 10. -- AGE-SPECIFIC DEATH RATES: ILLINOIS, 1980, 1990 AND 1991
(Rates per 100,000 population in specified age group)

Age (years)	1980	1990	1991

65 and over	5,471	5,175	5,183

Despite the declines in many of the age-specific death rates, the crude (all ages) death rate remained virtually unchanged (Figure 2). The reason is that, although the force of mortality has decreased, this has been offset by the general aging of the population. In other words, larger proportions of the population are in the older age groups, which have higher death rates, and this is the main reason for the lack of decline in the total number of deaths during the 1980s. According to the 1980 decennial census, the median age for Illinois in 1980 was 29.9 years, lower than the 32.6 years estimated for 1991. The crude death rate and the total number of deaths in 1991 would have been lower had the age structure remained the same as in 1980.

Age-specific death rates by sex and race for Illinois show that for each sex/age group, nonwhites had higher death rates than whites (Text Table 11). Nevertheless, the crude (all ages) death rate for nonwhites was lower than that for whites, especially for females. Again, the differences between the age-specific rates for nonwhites and whites compared to the differences between the crude rates is due to differences in age structure, with the nonwhite population having higher proportions among the younger age groups than the white population.

TEXT TABLE 11. -- AGE-SPECIFIC DEATH RATES BY SEX AND RACE: ILLINOIS, 1991
(Rates per 100,000 population in specified group)

Age (years)	Nonwhite			White		
	Total	Male	Female	Total	Male	Female
All ages	820	963	691	917	931	904
Under 1	1,943	2,137	1,742	794	889	695
1-4	97	102	91	44	49	38
5-14	42	49	34	20	25	15
15-24	183	287	79	85	122	45
25-44	387	578	224	135	190	80
45-64	1,274	1,719	913	727	917	546
65 and over	5,369	6,449	4,675	5,162	5,952	4,649

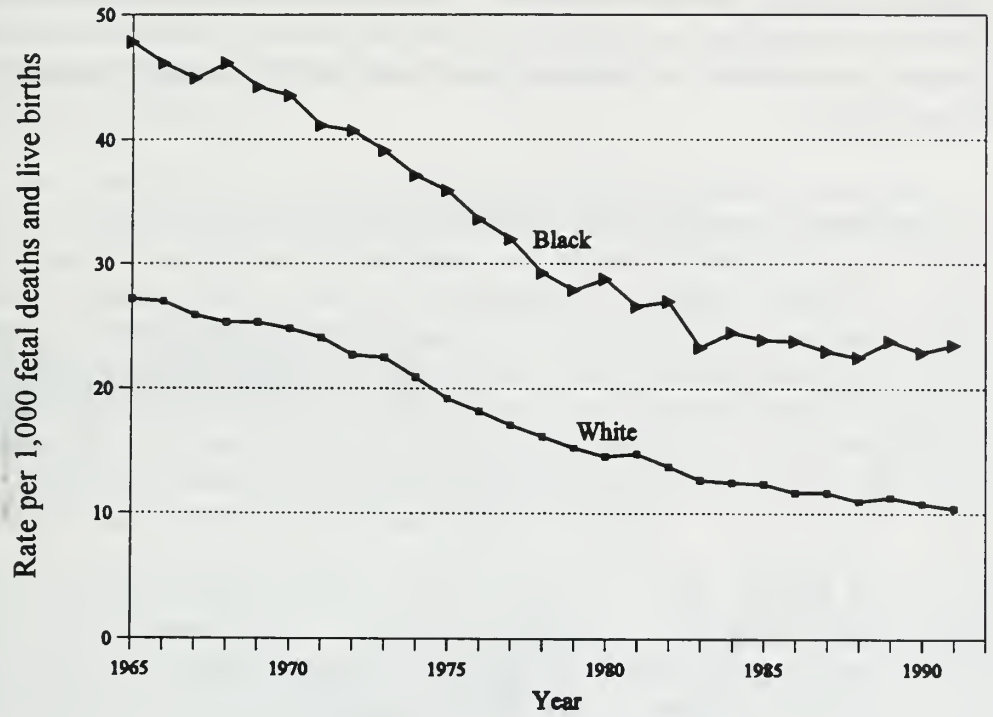
Differences also are apparent in the age-specific death rates between males and females. Among both nonwhites and whites, males exhibited higher death rates than females for every age group. The differences were particularly pronounced for the age groups 15 to 24, 25 to 44, and 45 to 64 years.

PERINATAL AND INFANT MORTALITY

Since many of the same causes underlie fetal deaths and deaths that occur among live-born infants soon after delivery, these losses are often combined and collectively termed "perinatal" deaths. Fetal deaths at 20 weeks gestation and later (and those of less than 20 weeks gestation for which fetal death certificates were filed) plus deaths of live-born infants younger than 7 days of age are used in this report to compute perinatal mortality. By this definition, there were 2,533 perinatal deaths among Illinois residents in 1991, comprising 1,418 fetal deaths and 1,115 early infant deaths (under 7 days), in total 120 fewer than in 1990. The 1991 perinatal mortality rate was 13.0 deaths per 1,000 fetal deaths and live births. This is a decrease of nearly 4 percent from the rate in 1990 and is consistent with the steady decline in perinatal mortality observed since 1965. Of total perinatal deaths, blacks accounted for a disproportionate share: 40 percent (1,013). As in previous

years, the perinatal mortality rate was more than twice as high for the black population (23.2) as it was for the white population (10.2). Even though the perinatal mortality rate among blacks has steadily declined since 1965, it has remained substantially higher than the rate among whites (Figure 5). Among Hispanics, the perinatal mortality rate was 10.1. For all races, the city of Chicago had a higher perinatal mortality rate than Downstate: 17.3 versus 11.0 (Table F).

FIGURE 5. -- PERINATAL MORTALITY RATES BY RACE: ILLINOIS, 1965-1991



In 1991 in Illinois, there were 1,367 infants who did not survive to 28 days old (neonatal mortality). This represents a neonatal mortality rate of 7.0 per 1,000 live births. This number of neonatal deaths and the rate were nearly the same as those in 1990 (1,368 and 7.0 respectively). In the last 20 years, the neonatal mortality rate has improved considerably from 16.5 in 1970 to 9.9 in 1980 and to 7.0 in 1991 (Table A). As in previous years, the neonatal death rate among black infants was more than twice as high as that among white infants in 1991: 13.5 per 1,000 live births for blacks compared with 5.3 for whites. The rate for Hispanics was 6.6.

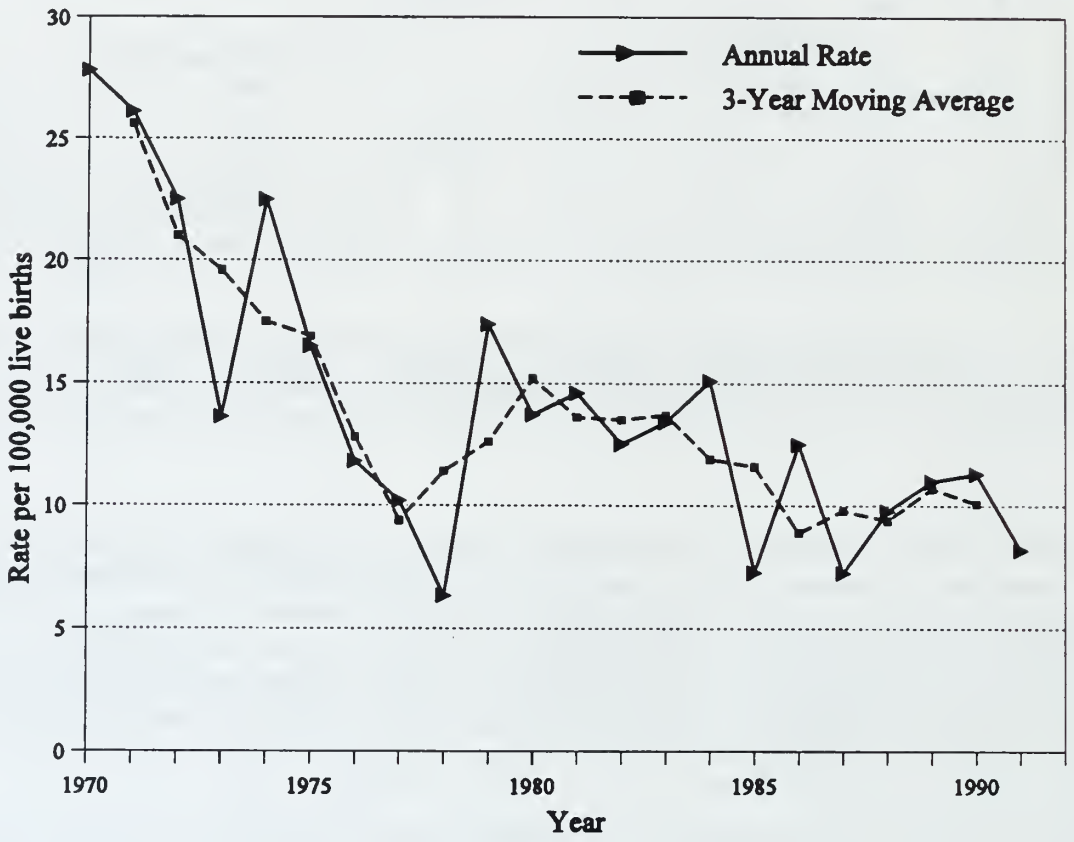
In 1991, there were 701 infants who lived at least 28 days but less than 365 days (postneonatal mortality), or 3.6 deaths per 1,000 live births. Again, black infants in this age group showed a much higher mortality rate than white infants; the postneonatal mortality rate for black infants was 7.5 per 1,000 compared with 2.5 for white infants and 3.2 for Hispanic infants.

In Illinois during 1991, the total number of infants who died before reaching 1 year old was 2,068 or 10.7 infant deaths per 1,000 live births. The infant mortality rate of 10.7 was identical to the 1990 value (Table A). However, the infant mortality rate for blacks (21.1) was nearly triple the rate for whites (7.9). Among Hispanics, the infant mortality rate was 8.6.

MATERNAL MORTALITY

In 1991, 16 women were reported to have died of complications of pregnancy, childbirth, and the puerperium (the period of confinement after labor). The maternal mortality rate for 1991 was 8.2 deaths per 100,000 live births, down from 11.3 in 1990, and lower than the rate in 1980 (13.7). Although the maternal mortality rate has fluctuated during the 1980s, there has been a general downward trend (Figure 6).

FIGURE 6. -- MATERNAL MORTALITY RATES: 1970-1991



Of the 16 maternal deaths in 1991, six were among whites and 10 among blacks. By county of residence, Cook had 12 maternal deaths, and Du Page, Jackson, Kane, and Rock Island counties each had one.

LEADING CAUSES OF DEATH

Maternal and infant deaths accounted for about 2 percent of the total deaths. In 1991, there were 103,871 deaths among Illinois residents and, as in 1990, the 12 leading causes of death accounted for approximately 84 percent of these deaths. Approximately two out of three deaths were caused by the first three leading causes of death: heart disease, malignant neoplasms (cancer) and cerebrovascular disease (stroke). Appendix 3 provides the classification of cause-of-death data presented in this publication.

Among the 12 leading causes of death (Tables O and P), there were some changes in their rankings from 1990 to 1991. Deaths due to chronic obstructive pulmonary disease and allied conditions moved ahead of pneumonia and influenza as well as unintentional injuries (formerly called accidents) so that in 1991 the fourth leading cause was chronic obstructive pulmonary disease. Pneumonia and influenza was ranked fifth. Unintentional injuries ranked sixth in 1991. Homicide rose from 10th to eighth among the leading causes in 1991 while suicide was ranked 11th. In 1991, congenital anomalies and perinatal conditions were separated into two causes: congenital anomalies, with 1,066 deaths, and certain conditions originating in the perinatal period, with 566 deaths. These two causes, combined into a single cause as in previous years, would have ranked eighth in 1991, above homicides and below diabetes mellitus.

Death rates were higher in 1991 than in 1990 for eight leading causes: heart disease; cerebrovascular disease; chronic obstructive pulmonary disease and allied conditions; diabetes mellitus; homicide; nephritis, nephrotic syndrome and nephrosis; septicemia; and suicide. The largest increase was for nephritis, nephrotic syndrome and nephrosis, which rose from 10.4 to 11.7 deaths per 100,000 population, or 12.5 percent. The next largest increase was for homicide, which rose from 11.7 to 12.5, or 6.8 percent. The largest decline was for unintentional injuries, which decreased between 1990 and 1991 from 33.8 to 32.3 deaths per 100,000 population, a 4.4 percent decrease. The second largest decline was for cirrhosis of the liver, which decreased from 12.0 to 11.7, or 2.5 percent.

Rates and ranks for the 12 leading causes of death varied by age (Tables P and Q). Among the 12 listed causes, unintentional injuries was the leading cause of death for persons under the age of 45 years. For persons 15 to 24 years of age, homicide was the second leading cause of death, with 30.8 deaths per 100,000 population, higher than the rate for deaths involving motor vehicles (26.3), a subcategory of unintentional injuries. For persons in the age group 25 to 44 years, the second most common cause was malignant neoplasms (26.9). The leading cause of death among persons 45 to 64 years of age was malignant neoplasms (296.8), followed by heart disease (240.8). For persons 65 years of age and over, the leading cause of death was heart disease, followed by malignant neoplasms.

The leading causes of death among whites and nonwhites were not the same for all age groups. For example, homicide was the most frequent cause of death among nonwhites 15 to 24 and 25 to 44 years of age and was the third most frequent cause of death among nonwhites overall in 1991 (Table H). Age-specific death rates for homicide among nonwhites were higher than those for whites in every age group (Table P). In contrast, age-specific suicide rates were higher among whites than nonwhites, especially for those 65 years of age and over. Deaths from heart disease and malignant neoplasms were commonly the leading two causes of death for both whites and nonwhites, accounting for 59.4 percent of all deaths among whites and 49.0 percent of all nonwhite deaths.

Chicago had higher death rates than Downstate for all the leading causes except cerebrovascular disease, suicide, and chronic obstructive pulmonary diseases and allied conditions (Table P). Ten leading causes of death by race are given in Table H. The 12 leading causes of death for residents of Illinois, Chicago and Downstate are given in Table O with corresponding rates in Table P. Table Q shows leading causes of death for selected age groups.

OTHER CAUSES OF DEATH

The next most frequent causes of death in 1991 were certain conditions originating in the perinatal period (1,066), human immunodeficiency virus (HIV) infection (1,050), aortic aneurism (810), Alzheimer's disease (708), and general atherosclerosis (684).

DEATHS FROM DRUGS

Deaths from drugs, excluding those from therapeutic misadventure, accounted for 511 deaths in 1991, four more than in 1990 (Text Table 12). Thirty more people 15 to 24 years of age died from drugs in 1991 than in 1990. Deaths from drugs were lower in 1991 than 1990 for all other age groups except those 35 to 44 years of age.

There were, however, many more deaths from drugs in 1991 than in 1980. While the number of deaths from drugs among persons 15 to 24 years of age declined, down from 70 in 1980 to 57 in 1991, the rate of death from drugs increased slightly. Deaths from drugs among those in all other age groups rose from 1980 to 1991. The largest increase was in the age group 35 to 44 years, which rose from a 1980 rate of 3.3 deaths per 100,000 population to 10.0 in 1991, or an increase of 134 deaths.

Among all deaths from drugs, 15 were classified as being due to drug dependence, seven to nondependent abuse of drugs, 355 to accidents, and 118 to suicides. There was one homicide and 15 other deaths due to drugs where the cause could not be determined.

TEXT TABLE 12. -- RESIDENT DEATHS AND DEATH RATES BY AGE FOR DEATHS FROM DRUGS[1]: ILLINOIS, 1980 AND 1989-1991
(Rates per 100,000 population in specified age group)

Age (years)	Deaths due to drugs							
	Number				Rate			
	1991	1990	1989	1980	1991	1990	1989	1980

65 and over	36	54	40	16	2.5	3.8	2.8	1.3

[1]Deaths assigned to category numbers 292, 304, 305.2-305.9, E850-E858, E950.0-E950.5, E962.0, E980.0-E980.5 of the 9th Revision International Classification of Diseases

YEARS OF POTENTIAL LIFE LOST (YPLL)

In 1991, among Illinois residents, there were an estimated 586,527 "years of potential life lost" (YPLL). YPLL is calculated by subtracting each decedent's age in years from 65 among those who died before reaching age 65 years and summing those numbers into a total. Age 65 is used as an arbitrary standard for the upper limit of "potential life." The average YPLL per death is calculated by dividing YPLL by the number of persons who died before reaching age 65. The 1991 Illinois average YPLL per death was 20.4 years (Table 13). This is higher than the 1989 and 1990 values of 20.1 and 20.0 years, respectively. (The higher the average YPLL per death, the younger the age below 65 years persons are dying, on average.)

Illinois' seven largest contributing causes of death to YPLL were unintentional injuries (91,083 years, of which 46,728 years are attributable to motor vehicle accidents), malignant neoplasms (82,331), certain conditions originating in the perinatal period (68,967), heart disease (68,362), homicide (49,461), congenital anomalies (31,339), and HIV infection (27,062). A comparison of the seven largest contributing causes of death to YPLL for Chicago and Downstate shows some differences (Figures 7 and 8). In Chicago, homicide was the largest contributing cause of death to YPLL and comprised 14.2 percent of all Chicago YPLL. For Downstate, homicide was the seventh largest contributing cause and accounted for 4.4 percent of all Downstate YPLL. The sixth largest contributing cause of death to YPLL for Chicago was HIV infection, which did not appear among the seven largest causes for Downstate. Similarly, the sixth largest contributing cause for Downstate was suicide, which did not appear among the seven largest causes for Chicago.

TEXT TABLE 13. -- THE SEVEN LEADING CAUSES OF DEATH CONTRIBUTING TO YEARS OF POTENTIAL LIFE LOST (YPLL) FOR ILLINOIS RESIDENTS: 1991

	Cause of death	YPLL	Percent of total	Deaths age 0-64	Average number of YPLL per death age 0-64 years
1	Unintentional injuries	91,083	15.5	2,729	33.4
2	Malignant neoplasms	82,331	14.0	7,546	10.9
3	Certain perinatal conditions	68,967	11.8	1,064	64.8
4	Heart disease	68,362	11.7	6,186	11.1
5	Homicide	49,461	8.4	1,396	35.4
6	Congenital anomalies	31,339	5.3	529	59.2
7	HIV infection	27,062	4.6	1,027	26.4
	All other causes	167,922	28.6	8,327	20.2
	TOTAL	586,527	100.0	28,804	20.4

The "average number of YPLL per death age 0-64 years" column in Text Table 13 illustrates the relative impact different causes of death contribute per death to YPLL. Causes of death where the average age at death is very young, such as certain conditions originating in the perinatal period and congenital anomalies, contribute heavily to YPLL per death (for Illinois, 64.8 and 59.2 years, respectively). The external causes of death of unintentional injuries, homicide, and suicide, along with the internal cause of HIV infection, more typically occur over a wider range of teen and adult ages, with death rates tapering toward the older adult ages. For Illinois, these causes of death contribute between 26.4 and 35.4 years per death to YPLL, on average. The two leading causes of death in Illinois, heart disease and malignant neoplasms, are the fourth and second largest contributing causes of death to YPLL because of the relatively late age at which death typically occurs for these causes. Therefore, each death due to these causes contributes relatively few years (approximately 11 years on average if the death occurred under age 65 years) or no years (if the death occurred at age 65 or over) to YPLL.

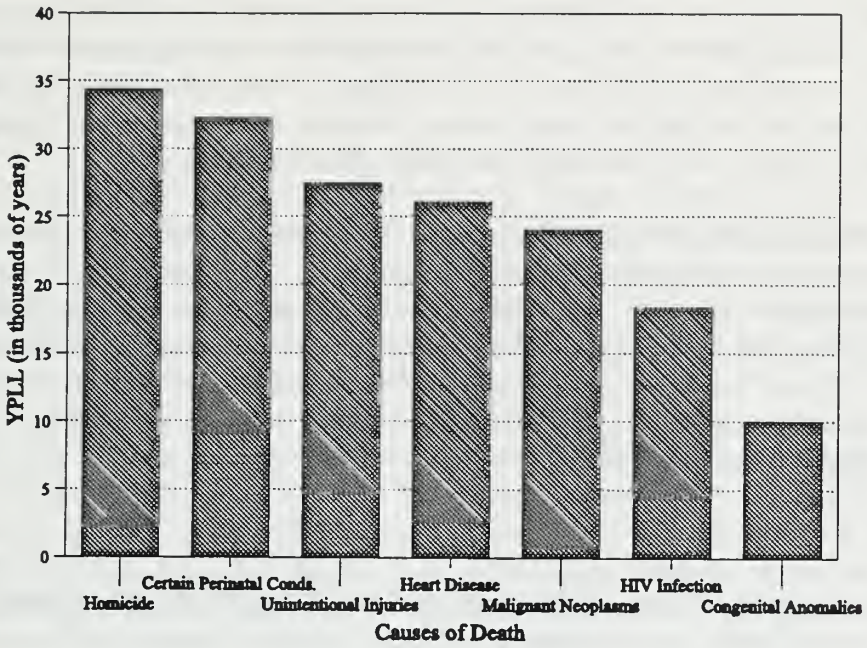

FIGURE 8. -- NUMBER OF YPLL* FOR THE SEVEN LARGEST CONTRIBUTING CAUSES: DOWNSTATE, 1991

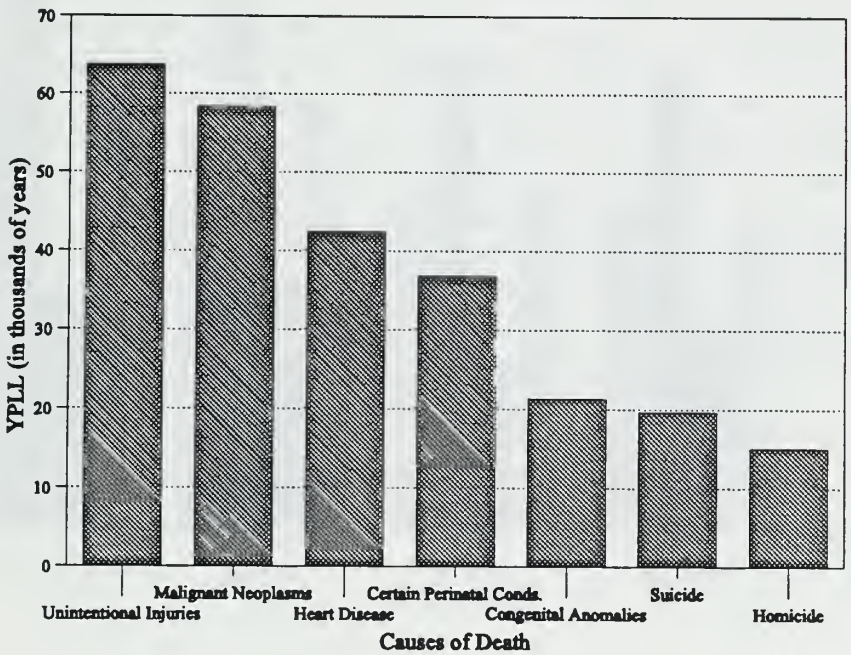


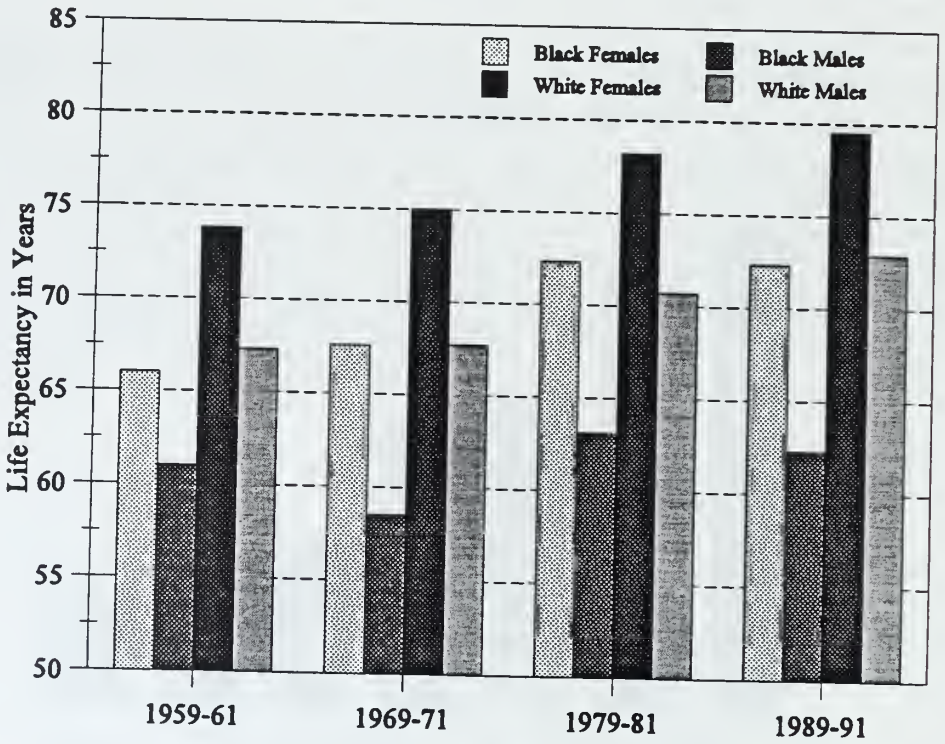
* Years of potential life lost

LIFE EXPECTANCY

The average expectation of life at birth represents the average number of years that a group of newborns would live if they were to collectively experience the age-specific death rates prevailing in 1989-91 throughout their lives. Life expectancy is calculated via a life table that combines death and population data to derive various mortality measures. (See Appendix 4 for a more complete explanation of life table functions and their derivation.)

In 1989-91, among all Illinois residents, the average life expectancy at birth was 75.0 years. For Illinois females the average life expectancy at birth was 78.4 years, and for Illinois males was 71.4 years (Text Tables 14 and 15). For 1979-81, the values were 77.3 years for females and 69.7 years for males. The 1989-91 life expectancies represent improvements from the previous decade of 1.1 years (1.4 %) for females and 1.7 years (2.4 %) for males. The difference in life expectancy at birth between the sexes decreased: females lived on average 7.6 years longer than males in 1979-81 and 7.0 years longer in 1989-91.

FIGURE 9. -- LIFE EXPECTANCY AT BIRTH BY RACE AND SEX: ILLINOIS, 1959-61 TO 1989-91



Among black Illinois residents, life expectancy at birth for 1989-91 was 72.3 years for females and 62.3 years for males (Text Tables 16 and 17). This represented no change from 1979-81 life expectancy for black females and a -0.8 year change (-1.3 %) for black males from the 63.1 years of average life expectancy at birth a decade earlier. This resulted in a 10.0 year difference in life expectancy at birth between the sexes for blacks for 1989-91, an increase from the 9.2 year difference in 1979-81.

Among white Illinois residents, average life expectancy at birth for 1989-91 was 79.5 years for females and 72.9 years for males (Text Tables 18 and 19). These values for 1979-81 were 78.2 years for white females and 70.7 years for white males. The gap between the sexes for life expectancy at birth was narrowed to 6.6 years for 1989-91 compared with 7.5 years in 1979-81. The gap between black and white life expectancy at birth, however, widened. For females, the 5.9 year difference in 1979-81 grew to a 7.2 year difference in 1989-91, and for males a 7.6 year difference increased to 10.6 years.

Figure 9 summarizes life expectancy at birth by race and sex for Illinois during the 30-year period from 1959-61 to 1989-91. The improvements in life expectancy during this period were an average of 6.3 years longer life from birth for black females, 1.3 more years for black males, 5.7 more years for white females, and 5.6 more years for white males. While the difference between black females and white females has narrowed from 7.8 years in 1959-61 to 7.2 years in 1989-91, the difference between black males and white males has increased over the same period from 6.3 years to 10.6 years. The largest improvements in life expectancy at birth for each of the race/sex groups all occurred from 1969-71 to 1979-81: 4.7 years for black females, 4.6 for black males, 3.2 years for white females, and 3.0 years for white males.

Although expectation of life at birth is the most often cited of the life expectancy values, it is useful to examine average remaining years of life at other ages. It is interesting to note, for example, that black infant mortality for both females and males has had a large enough influence that life expectancies at age 1 year were greater than at birth (both 0.7 years greater). This was not the case in the life tables for white females or white males. For all females in 1989-91, the life expectancy at age 40 years was an additional 40.4 years or a total average life expectancy of 80.4 years. This is 2.0 years greater compared to female life expectancy at birth. For all males, the values were an additional 34.8 years or living to age 74.8 years (3.4 years more compared to life expectancy at birth). For black females, life expectancy at age 40 was 76.2 years (white females, 81.0 years), and for black males it was 69.1 years (white males, 75.5 years). Similarly for age 65 years for black females, life expectancy was 82.1 years (white females, 84.1 years), and for black males it was 78.0 years (white males, 80.0 years).

VITAL STATISTICS SPECIAL REPORTS

To receive a copy of any Vital Statistics special report listed below, please specify the title of the report(s) and contact the Illinois Department of Public Health, Office of Epidemiology and Health Systems Development, Illinois Center for Health Statistics, 525 W. Jefferson St., Springfield, IL 62761; or phone 217-785-1064; TDD (for hearing impaired use only) 800-547-0466.

Mortality from Breast Cancer Among Illinois Women, 1969-71 and 1979-81

Mortality from Homicide Among Illinois Residents, 1969-71 and 1979-81

Mortality from Respiratory System Cancer Among Illinois Residents, 1969-71 and 1979-81

Mortality from Leukemia Among Illinois Residents, 1969-71 and 1979-81

Suicide Among Illinois Residents, 1969-71 and 1979-81

Mortality from Cancer of Genital Organs Among Illinois Residents, 1969-71 and 1979-81

Mortality Among Children Aged 1-14 Years in Illinois

Life Expectancy in Illinois: 1979-81 (Illinois Health Report Series 85-2)*

Life Expectancy in Illinois: Patterns Among Health Service Areas (Illinois Health Report Series 85-3)*

Differences in Mortality Among City and Rural Populations of Non-Metropolitan Illinois Counties (Illinois Health Report Series 85-4)*

Demographic Correlates of Low Birthweight in Illinois: 1980 and 1984

The Public Health Index: Measuring the Health of Illinois Residents (Illinois Health Report Series 88-1)*

Recent Trends in Suicide Among Illinois Residents

Recent Trends in Mortality from Respiratory System Cancer Among Illinois Residents

Recent Trends in Mortality from Breast Cancer Among Illinois Women

Recent Trends in Homicide Among Illinois Residents

Mortality from Drugs Among Illinois Residents: 1980-1987

Mortality from Firearms Among Illinois Residents: 1980-1988

Mortality from Diabetes Mellitus Among Illinois Residents: 1969-71 to 1986-88

*Available on microfiche only

TABLE A. – LIVE BIRTHS, DEATHS, INFANT DEATHS, NEONATAL DEATHS, AND MATERNAL DEATHS, WITH RATES FOR EACH, AND FETAL DEATHS, WITH RATIOS, ILLINOIS: 1918 - 1991

(LIVE BIRTH RATES AND DEATH RATES PER 1,000 ESTIMATED MIDYEAR POPULATION. INFANT AND NEONATAL DEATH RATES AND FETAL DEATH RATIOS PER 1,000 LIVE BIRTHS. MATERNAL DEATH RATES PER 10,000 LIVE BIRTHS)

TABLE Q. -- LEADING CAUSES OF DEATH BY SELECTED AGE GROUPS, ILLINOIS RESIDENTS: 1991

(For ages under 1 year, see Table G)

Age 1 - 4 years

Rank	Cause	9th Rev. Number [1]	Number
	All causes		383
1.	Unintentional injuries	E800-E949	148
	a. Motor vehicle	E810-E825	(33)
	b. All other	E800-E807, E826-E949	(115)
2.	Congenital anomalies	740-759	46
3.	Malignant neoplasms	140-208	26
4.	Homicide	E960-E978	22
4.	Heart disease	393-398, 402, 404-429	22
6.	Pneumonia and influenza	480-487	18
7.	Certain conditions originating in the perinatal period	760-779	7
7.	Infantile cerebral palsy	343	7
9.	Chronic obstructive pulmonary disease and allied conditions	490-496	6
9.	Meningitis	320-322	6

Age 5 - 14 years

	All causes		408
1.	Unintentional injuries	E800-E949	156
	a. Motor vehicle	E810-E825	(73)
	b. All other	E800-E807, E826-E949	(83)
2.	Malignant neoplasms	140-208	54
3.	Homicide	E960-E978	39
4.	Heart disease	393-398, 402, 404-429	23
5.	Congenital anomalies	740-759	18
6.	Infantile cerebral palsy	343	16
7.	Suicide	E950-E959	13
8.	Cerebrovascular disease	430-438	8
9.	Chronic obstructive pulmonary disease and allied conditions	490-496	7
10.	Human immunodeficiency virus infection	042-044	4

Age 15 - 24 years

	All causes		1,748
1.	Unintentional injuries	E800-E949	625
	a. Motor vehicle	E810-E825	(434)
	b. All other	E800-E807, E826-E949	(191)
2.	Homicide	E960-E978	509
3.	Suicide	E950-E959	211
4.	Malignant neoplasms	140-208	71
5.	Heart disease	393-398, 402, 404-429	67
6.	Congenital anomalies	740-759	25
7.	Human immunodeficiency virus infection	042-044	21
8.	Pneumonia and influenza	480-487	20
9.	Chronic obstructive pulmonary disease and allied conditions	490-496	16
10.	Cerebrovascular disease	430-438	12
10.	Injury undetermined whether accidentally or purposely inflicted	E980-E989	12

TABLE Q. -- LEADING CAUSES OF DEATH BY SELECTED AGE GROUPS, ILLINOIS RESIDENTS: 1991-- CONTINUED

(For ages under 1 year, see Table G)

Age 25 - 44 years

Rank	Cause	9th Rev. Number [1]	Number
	All causes		6,735
1.	Unintentional injuries	E800-E949	1,182
	a. Motor vehicle	E810-E825	(579)
	b. All other	E800-E807, E826-E949	(603)
2.	Malignant neoplasms	140-208	1,009
3.	Heart disease	393-398, 402, 404-429	866
4.	Human immunodeficiency virus infection	042-044	798
5.	Homicide	E960-E978	630
6.	Suicide	E950-E959	447
7.	Chronic liver disease and cirrhosis	571	326
8.	Cerebrovascular disease	430-438	164
9.	Pneumonia and influenza	480-487	133
10.	Diabetes mellitus	250	114

Age 45 - 64 years

	All causes		17,462
1.	Malignant neoplasms	140-208	6,384
2.	Heart disease	393-398, 402, 404-429	5,179
3.	Cerebrovascular disease	430-438	694
4.	Unintentional injuries	E800-E949	563
	a. Motor vehicle	E810-E825	(260)
	b. All other	E800-E807, E826-E949	(303)
5.	Chronic obstructive pulmonary disease and allied conditions	490-496	552
6.	Chronic liver disease and cirrhosis	571	547
7.	Diabetes mellitus	250	470
8.	Pneumonia and influenza	480-487	295
9.	Suicide	E950-E959	267
10.	Human immunodeficiency virus infection	042-044	202

Age 65 years and over

	All causes		75,067
1.	Heart disease	393-398, 402, 404-429	29,375
2.	Malignant neoplasms	140-208	16,842
3.	Cerebrovascular disease	430-438	5,995
4.	Pneumonia and influenza	480-487	3,427
5.	Chronic obstructive pulmonary disease and allied conditions	490-496	3,267
6.	Diabetes mellitus	250	1,713
7.	Nephritis, nephrotic syndrome and nephrosis	580-589	1,142
8.	Unintentional injuries	E800-E949	1,003
	a. Motor vehicle	E810-E825	(273)
	b. All other	E800-E807, E826-E949	(730)
9.	Septicemia	038	881
10.	Alzheimer's disease	331.0	697

[1]Numbers are category numbers of the Ninth Revision International Classification of Diseases (ICD-9).

PERSONS OF HISPANIC ORIGIN MAY BE OF ANY RACE.
MORTALITY RATES ARE PER 100,000 POPULATION IN SPECIFIED AGE GROUP.
YPLL - YEARS OF POTENTIAL LIFE LOST. CALCULATED BASED ON THE NUMBERS OF YEARS BETWEEN AGE AT DEATH AND AGE 65.
* - A RATE OR RATIO DOES NOT MEET STANDARDS OF RELIABILITY OR PRECISION.
-0- - RATE O CORRESPONDING TO -- ON FREQUENCIES.
(1) - INCLUDES RACES OTHER THAN WHITE AND BLACK.
(2) - EQUIVALENT TO ACCIDENTS.

APPENDIX 1. DATA SOURCES AND ANALYSIS

VITAL RECORDS SYSTEM

State statute requires that all vital record certificates be filed with the Illinois Department of Public Health. The director of the Department is also the state registrar who, in turn, delegates authority to the deputy state registrar to administer and enforce the Vital Records Act. The requirement to register births and deaths was first included in the legislation that established the State Board of Health in 1877. However, the law did not provide workable enforcement, and the system failed for lack of central legal control over the data collection process. After several attempts, a law incorporating the elements of an efficient system became effective January 1, 1916. Slight modifications were made over the years until January 1, 1962, when the current law, including several significant provisions, became effective.

The original live birth, death, and fetal death certificates are collected by local registrars of vital records who are appointed by, and are under direct supervision of, the state registrar. Local registrars keep a copy of each certificate for their files and for the files of the county clerk and send the original to the Illinois Department of Public Health. (See Exhibits 1 through 6 for copies of sample certificates.)

Insuring that a certificate of live birth is filed is the responsibility of the hospital administrator when the birth occurs in a hospital. The attending physician verifies or provides the date of birth and required medical information. When births occur outside hospitals, the physician or other attendant prepares and files the certificate.

Funeral directors must file death certificates with the local registrar in the area in which the death occurred in order to obtain legally necessary burial or removal permits. (A fetal death certificate must be prepared if the fetus is determined to be a product of 20 or more completed weeks of gestation and not born alive.) Medical certification, including a determination of the cause of death, is completed by the physician in charge of the decedent's care unless a cororner's or medical examiner's certificate is filed. A physician may request that a coroner or medical examiner review any death.

The coroner's physician, whose position was established by the Coroner's Act of 1957, is unique in Illinois. When requested, the coroner's physician investigates a death involving a motor vehicle accident, other accidents and forms of violence, suspicious circumstances, or a person found dead. Programs related to boating, recreational gun usage, highway safety, hazardous substance control, drug abuse, law enforcement, suicide prevention, hospital and nursing home construction, home construction, home safety and pesticide control rely heavily on the findings of the coroner, the coroner's physician and, in Cook County, the medical examiner.

The registration system also provides for amendments of birth and death certificates, preparation of new documents for adopted and legitimated children, and the certification of the contents of a record when a citizen needs it.

Central registration of marriages and divorces began on January 1, 1962. Prior to that date, annual counts of marriages and divorces by county were made intermittently. Since 1962, marriage records are filed directly with the Illinois Department of Public Health by county clerks. The application record combines information supplied by applicants for the license and by the marriage officiant. Certificates of divorce or annulment are filed directly with the Department by the clerk of the circuit court. Each certificate contains information supplied by the attorney for the petitioner and from the divorce or annulment decree.

The Division of Vital Records inspects the certificates and requests supplemental information on those that are incomplete, inconsistent or unclear. When a certificate is judged to be acceptable, coded information from the certificate is entered on magnetic tapes for statistical purposes and this information is shared with the National Center for Health Statistics. In 1985, the Division of Vital Records introduced an on-line live birth record system for all births occurring in Illinois.

CUTOFF DATES AND INTERSTATE EXCHANGE

There is no cutoff date for the filing of a vital record as a legal document. However, there must be a cutoff date for inclusion of events in a publication. The cutoff date for 1991 events was April 1992.

Copies of vital record certificates pertaining to persons who were born or died outside of the state of residence are exchanged, usually on a monthly basis, with all of the states and the Canadian provinces. The original birth, fetal death, or death certificate is never released or received in these transactions. There is no exchange of marriage, divorce or annulment data.

RACIAL CLASSIFICATION

For statistical purposes, vital events in Illinois are classified by race into white, black, American Indian, Chinese, Hawaiian, Japanese, Filipino, other Asian or Pacific Islander and other. Racial classification for a decedent, bride, groom or for divorcing spouses is based on race stated on the vital record certificate. Prior to 1989, the racial designation used for a live birth or fetal death was determined through an algorithm based on the race of both parents, as reported on the certificate. Since data year 1989, racial classification of live births and fetal deaths has been based solely on the reported race of the mother.

The tables in this report do not show data for a detailed classification by race. In some tables the divisions are white, black, and other. In other tables the classifications are simply white and nonwhite.

HISPANIC ORIGIN

In 1979, an item was added to the birth and death certificates to identify ethnic origin of a newborn's parents and of a decedent. An open ended format was used to obtain the specific origin or descent (e.g., Italian, Mexican, English). In 1989, the item was changed to a format directed toward the Hispanic population, requesting only the specific Hispanic origin (e.g., Mexican, Puerto Rican).

COMPUTATION OF PERCENTS

Births with unknown age of mother, month of pregnancy in which prenatal care began, educational attainment of mother, method of delivery, and Apgar scores were subtracted from the figures for total births that were used as denominators before percentages were computed. Percent distributions for marriages and divorces also exclude cases for which the pertinent information (e.g., duration of marriage) is not stated.

INTERPRETATION OF VITAL STATISTICS

Qualifying factors to be considered in the interpretation of vital statistics depend on the specific administrative, scientific or planning purposes for which the data are to be used. It is not feasible to discuss all of the pertinent factors in the use of vital statistics, but the following are some of the more important ones that should be taken into account:

1. Incomplete information. There are failures to provide certain types of information requested on the vital records certificates. Also, the classification systems used to prepare information on the certificates for tabulation do not employ categories that are suitable for every purpose.

2. Erroneous information. Despite procedures used to obtain, process and transmit accurate information, the user of vital statistics should not disregard the possibility of errors.

3. Lack of precise populations exposed to risk requires using estimates that may, in some instances, be inaccurate.

4. Crude rates. Most rates in this report are not adjusted to control for differences in the age, race or sex composition of populations in different geographical areas or at different periods of time. Divorce rates are not adjusted for peaks in marriage registrations in earlier years.

5. Some tables are designed to focus attention on selected risk groups. Other risk factors could have been selected.

6. Rate stability. Rates based on a small number of events tend to exhibit considerable variation over time because of chance fluctuations. Excessive variation in rates not only negates their utility as estimators of a probability of an event occurring, but also negates their usefulness for comparative purposes.

   In Part II of this report, an asterisk is substituted for a printed rate if the rate is based on a numerator less than 10 or a denominator less than 100. These criteria have been adopted to avoid printing rates that are subject to especially large fluctuations.

   The numbers "10" and "100" are arbitrary and are not set forth as critical points distinguishing statistically reliable rates from unreliable rates.

   To obtain meaningful information for small areas (e.g., counties), rates are presented in Part II that are based on events aggregated over five years. This method of obtaining greater rate stability may obscure major changes that have occurred over time.

APPENDIX 2. DEFINITIONS OF TERMS, RATES AND RATIOS

AGE

Age in years as of last birthday. For infants, age may be stated in days, weeks or months.

BIRTH ORDER

The total number of births the mother has had, including live births and terminations of pregnancy, both spontaneous and induced.

BIRTHWEIGHT

Weight of fetus or infant at time of delivery.

FETAL DEATH

Death prior to the complete expulsion or extraction from its mother of a product of conception, having completed at least 20 weeks of gestation; the fetus shows no signs of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

FIRST PARITY

The first live birth a mother has delivered.

INFANT DEATH

Death occurring to an individual of less than 1 year of age. The term excludes fetal deaths.

LIVE BIRTH

The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life such as beating of the heart, pulsation of umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

MATERNAL DEATH

Death for which the certifying physician has designated a complication of pregnancy, childbirth or the puerperium as the underlying cause of death.

METROPOLITAN COUNTY

A county with at least one city of 50,000 inhabitants or with "twin cities" with a combined population of at least 50,000; part of a metropolitan statistical area (MSA). Metropolitan county and MSA status are defined and determined by the U. S. Office of Management and Budget.

NEONATAL DEATH

Death occurring to an individual less than 28 days of age.

OCCURRENCE RATE

Location of event happening. Some rates are calculated according to where the event occurred, regardless of residence, e.g. marriage and divorce rates.

PERINATAL DEATH

A fetal death or a death occurring to an individual less than 7 days of age.

PREMATURE BIRTH

A live birth or fetal death in which the weight is 2,500 grams (approximately 5 lb. 8 oz.) or less at time of delivery.

RESIDENCE

Usual place of residence. For births and fetal deaths, usual place of residence of mother is used. Some rates are calculated according to place of residence, regardless of where event occurred.

UNDERLYING CAUSE OF DEATH

Disease or condition that gave rise to the chain of morbid events leading to death, or the circumstances of the accident or violence that produced the fatal injury. See Appendix 3 for the causes and ICD numbers used in this report.

Rates and Ratios

Definitions of selected rates and ratios are presented below. No attempt is made to present the method of calculating each vital rate or ratio contained in this report.

The principles applied in computing age-specific, race-specific or other category-specific vital rates may be inferred from the definitions given below for certain category-specific death rates.

(Crude) death rate =

$$1{,}000 \text{ or } 100{,}000 \times \frac{\textit{number of deaths}}{\textit{population}}$$

Cause-specific death rate =

$$100{,}000 \times \frac{\textit{number of deaths from the cause}}{\textit{population}}$$

Race-specific death rate =

$$100{,}000 \times \frac{\textit{number of deaths for the race}}{\textit{population for that race}}$$

Age-specific death rate =

$$100{,}000 \times \frac{\textit{number of deaths for the age}}{\textit{population for that age}}$$

Maternal mortality rate =

$$10{,}000 \text{ or } 100{,}000 \times \frac{\textit{number of maternal deaths}}{\textit{number of live births}}$$

Perinatal mortality rate (sometimes designated as a ratio) =

$$1{,}000 \times \frac{\textit{number of deaths under 7 days of age + fetal deaths}}{\textit{number of live births + fetal deaths}}$$

Fetal death rate =

$$1{,}000 \times \frac{\textit{number of fetal deaths}}{\textit{number of live births + fetal deaths}}$$

Fetal death ratio =

$$1{,}000 \times \frac{\textit{number of fetal deaths}}{\textit{number of live births}}$$

Infant mortality rate =

$$1{,}000 \times \frac{\textit{number of deaths under 1 year of age}}{\textit{number of live births}}$$

Neonatal mortality rate =

$$1{,}000 \times \frac{\textit{number of deaths under 28 days of age}}{\textit{number of live births}}$$

Postneonatal mortality rate =

$$1{,}000 \times \frac{\textit{number of deaths from ages 28 days through 11 months}}{\textit{number of live births}}$$

Years of potential life lost (YPLL) = $\Sigma \left(\begin{array}{c} 65 - \textit{decedent's age in years for those} \\ \textit{who died before reaching their 65th birthday} \end{array} \right)$

(Crude) live birth rate = $1{,}000 \times \frac{\textit{number of births}}{\textit{population}}$

(General) fertility rate = $1{,}000 \times \frac{\textit{number of live births to women of all ages}}{\textit{number of women 15 to 44 years of age}}$

Age-specific birth rate = $100{,}000 \times \frac{\textit{number of births to women of specified age}}{\textit{number of women of that age}}$

Teenage live birth ratio = $1{,}000 \times \frac{\textit{number of live births to women under 20 years of age}}{\textit{number of live births to women of all ages}}$

Ratio of out-of-wedlock childbearing = $1{,}000 \times \frac{\textit{number of live births to unmarried women}}{\textit{number of live births}}$

(Crude) marriage rate = $1{,}000 \times \frac{\textit{number of marriages}}{\textit{population}}$

(Crude) divorce rate = $1{,}000 \times \frac{\textit{number of divorces and annulments}}{\textit{population}}$

APPENDIX 3. CAUSE-OF-DEATH CLASSIFICATION

Cause-of-death data presented in this publication were classified according to the International Classification of Diseases (ICD) and coded by procedures outlined in World Health Organization regulations.

Revisions in the ICD are made about every 10 years to reflect progress in medical knowledge and changes in the experience of morbid conditions. The eighth revision of the ICD was used in Illinois from 1969 through 1978. Use of the ninth revision began in 1979. The introduction of a new revision often entails major changes in classifications that cause breaks in the continuity of mortality statistics.

When more than one cause of death is cited on the certificate, the cause designated by the certifying physician as "underlying" is, generally, the cause tabulated. When the underlying cause is unclear, the physician is queried for clarification.

ICD ninth revision category numbers for selected causes of death are given below.

CATEGORY NUMBERS FOR SELECTED CAUSES OF DEATH ACCORDING TO NINTH REVISION INTERNATIONAL CLASSIFICATION OF DISEASES ADAPTED FOR USE IN THE UNITED STATES (1975)

I.	Infective and parasitic diseases	001-139
	Intestinal infectious diseases	001-009
	Shigellosis	004
	Gastroenteritis and colitis	009.0-009.1
	Diarrheal diseases	009.2-009.3
	Tuberculosis	010-018
	Late effects of tuberculosis	137
	Zoonotic bacterial diseases	020-027
	Other bacterial diseases	030-041
	Diphtheria	032
	Whooping cough	033
	Streptococcal sore throat and scarlet fever	034
	Meningococcal infection	036
	Tetanus	037
	Septicemia	038
	Gas gangrene	040.0
	Human immunodeficiency virus infection	042-044
	Acute poliomyelitis	045
	Late effects of poliomyelitis	138
	Slow virus infection of central nervous system	046
	Chicken pox	052

Herpes zoster 053
Herpes simplex 054
Measles (rubeola) 055
Rubella 056
Viral hepatitis 070
Rabies 071
Mumps 072
Infectious mononucleosis 075
Typhus 080-081
Rocky mountain spotted fever 082.0
Malaria 084
Syphilis 090-097
Gonococcal infections 098
Other venereal diseases 099
Mycoses (fungus infections) 110-118
Sarcoidosis 135
Pneumocystosis 136.3

II. Malignant neoplasms 140-208
Lip, oral cavity and pharynx 140-149
Digestive organs and peritoneum 150-159
Respiratory system 160-165
Trachea, bronchus and lung 162
Breast 174-175
Genital organs 179-187
Urinary organs 188-189
Other and unspecified sites 170-173, 190-199
Leukemia 204-208
Other lymphatic and hematopoietic 200-203

III. Endocrine, nutritional and metabolic diseases 240-279
Diabetes mellitus 250
Cystic fibrosis 277.0

IV. Diseases of blood and blood forming organs 280-289
Anemia 280-285

V. Mental disorders 290-319
Drug dependence 304

VI. Diseases of nervous system and sense organs 320-389
Meningitis 320-322
Alzheimer's disease 331.0
Infantile cerebral palsy 343

Epilepsy 345
Muscular dystrophy 359

VII. Diseases of the circulatory system 390-459
Heart disease 393-398, 402, 404-429
Chronic rheumatic 393-398
Hypertensive heart disease 402
Hypertensive heart and renal disease 404
Ischemic heart disease 410-414
Acute myocardial infarction 410
Other acute and subacute forms 411
Angina pectoris 413
Chronic ischemic heart disease 412, 414
Other diseases of endocardium 424
All other forms 415-423, 425-429
Hypertension without mention of heart 401, 403
Cerebrovascular disease 430-438
Subarachnoid hemorrhage 430
Cerebral hemorrhage 431-432
Cerebral thrombosis 434.0, 434.9
Cerebral embolism 434.1
All other 433, 435-438
General arteriosclerosis 440
Other circulatory diseases 390-392, 441-459
Aortic aneurysm 441

VIII. Diseases of the respiratory system 460-519
Acute upper respiratory infections 460-465
Acute bronchitis and bronchiolitis 466
Pneumonia 480-486
Influenza 487
Chronic obstructive pulmonary diseases and allied conditions 490-496
Bronchitis, chronic and unspecified 490-491
Emphysema 492
Asthma 493
Bronchiectasis and extrinsic allergic alveolitis 494-495
Chronic obstructive lung disease, not elsewhere classified 496

IX. Diseases of the digestive system 520-579
Ulcer of stomach and duodenum 531-533
Hernia and intestinal obstruction 550-553, 560
Gastritis, duodenitis, enteritis, colitis 535, 555-558

Cirrhosis of liver 571

X. Diseases of the genitourinary system 580-629
Nephritis, nephrotic syndrome and nephrosis 580-589
Infections of kidney 590
Hyperplasia of prostate 600

XI. Complications of pregnancy, childbirth and the puerperium 630-676

XII. Congenital anomalies 740-759
Nervous system 740-742
Heart 745-746

XIII. Certain conditions originating in the perinatal period 760-779
Maternal unrelated to pregnancy 760
Maternal infections 760.2
Maternal complications of pregnancy 761
Premature rupture of membranes 761.1
Multiple pregnancy 761.5
Maternal death 761.6
Complications of placenta, cord and membranes 762
Placenta conditions 762.0-762.3
Prolapsed cord 762.4
Other cord conditions 762.5-762.6
Other complications of labor and delivery 763
Birth trauma 767
Intrauterine hypoxia and birth asphyxia 768
Respiratory distress syndrome 769
Other respiratory conditions of fetus and newborn 770
Fetal and neonatal hemorrhage 772
RH incompatibility 773.0
Other haemolytic diseases 773.1-773.5

XIV. Symptoms, signs and ill-defined conditions 780-799
Senility without mention of psychosis 797
Sudden death, cause unknown 798
Sudden infant death syndrome 798.0

XV. Unintentional Injuries E800-E949
Motor vehicle E810-E825
Collision E810-E815
Pedestrian E814
Other motor vehicle E811-E812
Railroad train E810

Bicycle E813.6
Fixed object E815
Other collision ..... E813 exc. E813.6
Non-collision E816-E825
Running off road E816
Other traffic E817-E819
Non-traffic E820-E825
Non-motor vehicle transport E800-807, E826-E848
Other vehicle E826-829, E846-E848
Water transport E830-E838
Aircraft E840-E845
Railway E800-E807
Non-transport accidents E850-E949
Poisonings E850-E869
Drugs and medicaments E850-E858
Falls E880-E888
Fire and explosion E890-E899
Firearms E922
Mechanical suffocation E911-E913
Drownings E910
Other and late effects ..... remainder of E800-E869, E880-E929
Therapeutic and non-therapeutic complications E870-E879, E930-E949

XVI. Suicide E950-E959
Drugs and medicaments E950.0-E950.5
Solid and liquid substances E950.6-E950.9
Gases and vapor E951-E952
Hanging, strangulation and suffocation E953
Handgun E955.0
All other and unspecified firearms E955.1-E955.4
All other and late effects of self inflicted injury E954, E955.5-E959

XVII. Homicide E960-E978
Assault by handgun E965.0
Assault by other and unspecified firearms E965.1-E965.4
Assault by cutting and piercing instrument E966
Assault by all other means and late effects of injury purposely inflicted by other persons E960-E964, E965.5-E965.9, E967-E969
Legal intervention E970-E978

XVIII. Injury undetermined whether accidentally or purposely inflicted E980-E989
Drugs and medicaments E980.0-E980.5

APPENDIX 4. LIFE TABLE CONSTRUCTION

Life tables are a type of survival analysis where age-specific death rates are applied to a hypothetical cohort to derive life expectancy and other survivorship measures. The abridged period life table, the most commonly used type, appears in this publication (pages I.32-I.34). Abridged refers to the fact that the life table contains data for age groups instead of single-year ages. Period means the current or a particular period's age-specific death rates are applied to the life table's hypothetical cohort, instead of tracking a real cohort throughout their lives, to see what levels of mortality the cohort actually experienced. The life tables in this publication were constructed using the method found in Robert Schoen's article, "Calculating Life Tables by Estimating Chiang's α from Observed Rates" (*Demography* 15(4): 625-635, November 1978).

Three years of mortality data (1989-91) were averaged to minimize the effects of influenza epidemics and other periodic or one-time mortality influences. The population data, combined with the mortality data to calculate age-specific death rates, were the 1990 Modified Age/Race/Sex (MARS) counts from the U.S. Bureau of the Census. The MARS data represent improvements, especially for race and age, over the original 1990 census data. Both the mortality and population data inputs were left unsmoothed, meaning no improvements were made to mitigate or correct for irregularities or inconsistencies.

The following is a brief explanation of the columns shown in the life tables. For a more complete explanation of life table functions, see *The Methods and Materials of Demography*, by Henry Shryock and Jacob Siegel, 1980 (4th ed.), U.S. Department of Commerce, Bureau of the Census.

x The age in years at the start of the interval. The interval implied is the age at the start through to, but not including, the next stated age.

${}_nq_x$ The probability of dying during the age interval.

l_x Of a hypothetical birth cohort of 100,000 (or some other arbitrary starting number called a radix), the number alive at the start of the age interval.

${}_nd_x$ Of a hypothetical birth cohort of 100,000 experiencing the ${}_nq_x$ values at each interval, the number dying during the age interval.

${}_nL_x$ Of a population experiencing constant rates of mortality, number of births, age structure, and size (stationary population), the number of person-years lived during the age interval.

T_x Of the stationary population, the total number of person-years lived in the age interval and all subsequent age intervals.

e_x The expectation of life remaining at the start of the age interval.
